A good servant makes a good master.

DEFINITIONS AND RULES.

1. A Cipher by itself signifies nothing ; set to the left hand of another figure, it alters not its value ; but placed at the right hand of any figure, it increases its value tenfold.
2. In Addition, the given numbers may be two or more ; and the number found is called the sum.
3. In Subtraction, the given numbers are called the greater and less ; and the result, the difference or remainder.
4. In Multiplication, the given numbers are called factors ; the number to be multiplied is called the multiplicand ; that by which it is multiplied, the multiplier ; and the number found, the product.
5. In Division, the number to be divided is called the dividend ; that by which it is divided, the divisor ; and the number found, the quotient. If there be a remainder, it is of the same name as the dividend.
6. To find the sum of any numbers, add.
To find the difference, subtract.
To find the product, multiply.
To find the quote or quotient, divide.
7. To bring a smaller coin, weight or measure, to a greater, divide.
8. To reduce a greater coin, weight or measure, to a smaller, multiply.
9. By *Troy* weight are now weighed gold, silver, jewels, and liquors ; it is also used in philosophical experiments.
10. *Avoirdupois* signifies a medium of weight. By it are weighed all goods subject to waste, as groceries of all kinds, such as tallow, pitch, butter, beef, pork, hemp, flax, wool, sugar, tea, &c.; and all kinds of metals, except gold and silver.

A faithful friend is a strong defence.

The number of days in each month may be remembered by means of the following lines:

Thirty days hath September,
April, June, and November;
February has twenty-eight alone,
And all the rest have thirty-one.
But leap year coming once in four,
February then has one day more.

A civil or common year = 52 weeks 1 day.
A leap year = 366 days.

Every year which is divisible by 4 without a remainder is a leap or bissextile year, except those years which complete a century (*i.e.* a hundred years) the numbers expressing which century are not divisible by 4. Thus 1600 and 2000 are leap years, because 16 and 20 are exactly divisible by 4; but 1700, 1800, and 1900, are not leap years, because 17, 18 and 19 are not exactly divisible by 4.

For every farthing which one pound costs, reckon twice as many shillings, and once as many groats; their sum will be the value per cwt.

EXAMPLE.

$7\frac{1}{2}$ =30 farthings, which doubled=60 shillings.
30 groats,=10 shillings.

EXPLANATION OF THE ABOVE TABLE.

Look along the top of the Table for the month in which the time commences; then east your eye down the column till you come to the number opposite the month in which the time terminates; those figures will show the number of days from any day of the former to the same day of the latter month. Suppose that the number of days between the ninth of May and the ninth of December were wanted to be known; carry the eye along the top of the table to May, then down the column under it, till you come to the number in a line with December printed on the side of the Table, and there you will find 214, the number of days required.

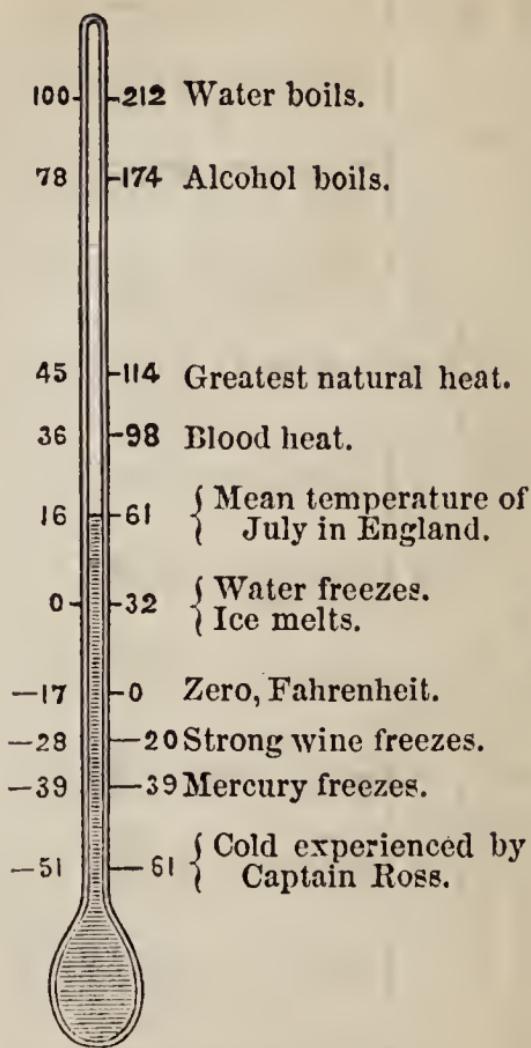

This table is computed for the common year only; in leap years, if February be included in the reckoning, add one day additional to the number of days; as February, in leap years, has 29 days.

Silence is a cheap virtue.

Study to be useful, rather than diverting.

Sneer not at that you cannot rival.

Seek every opportunity to do good.

THERMOMETER,

With the mercury standing at mean summer heat, and a scale of the chief points of temperature useful to be remembered. On the right side, the scale is that of Fahrenheit; the corresponding degrees on the left side, are those of the Centigrade thermometer.

Scorn to do a mean action.

The path of virtue is the path of peace.

Truth never fears rigid examination.
